- Abstract
- Objectives
- Advantages
- Limitations
- Future Improvements
- Conclusion

Introduction

- Today, we would like to present our project, Smart & Green City Platform.
- Nowadays, as cities continue to grow, the amount of waste is also increasing. However, not everything that we throw away is actually waste.
- Many unwanted items can still be reused, resold, or recycled.
- The problem is that people often do not know where to resell unwanted items, where to recycle them, or how they can contribute to environmental activities in their community.
- Therefore, our project aims to transform the way people think about waste.
- “Don’t just throw it away. Give it another way.”
- Our project is not just a recycling website or a marketplace website.
- It is a Smart & Green City Platform built around three main concepts: Reuse, Recycle, and Activity.

Abstract

- The Smart & Green City Platform is a digital solution designed to address urban waste problems and encourage citizens to make better use of unwanted items.
- The first component is Reuse and Resell. Users can upload unwanted items to the platform and either resell them or make them available for others to reuse. This helps extend the useful life of products and prevents usable items from becoming waste.
- The second component is Recycle. The system helps users identify recyclable materials and connect them with appropriate recycling processes or recycling points.
- The third component is Activity. Instead of simply telling people to protect the environment, our system encourages them to take action through green activities, challenges, and community participation.
- Therefore, our system creates a continuous cycle:
Reuse → Recycle → Activity
- The ultimate goal is to reduce waste, encourage responsible consumption, increase community participation, and contribute to building a cleaner and more sustainable city.

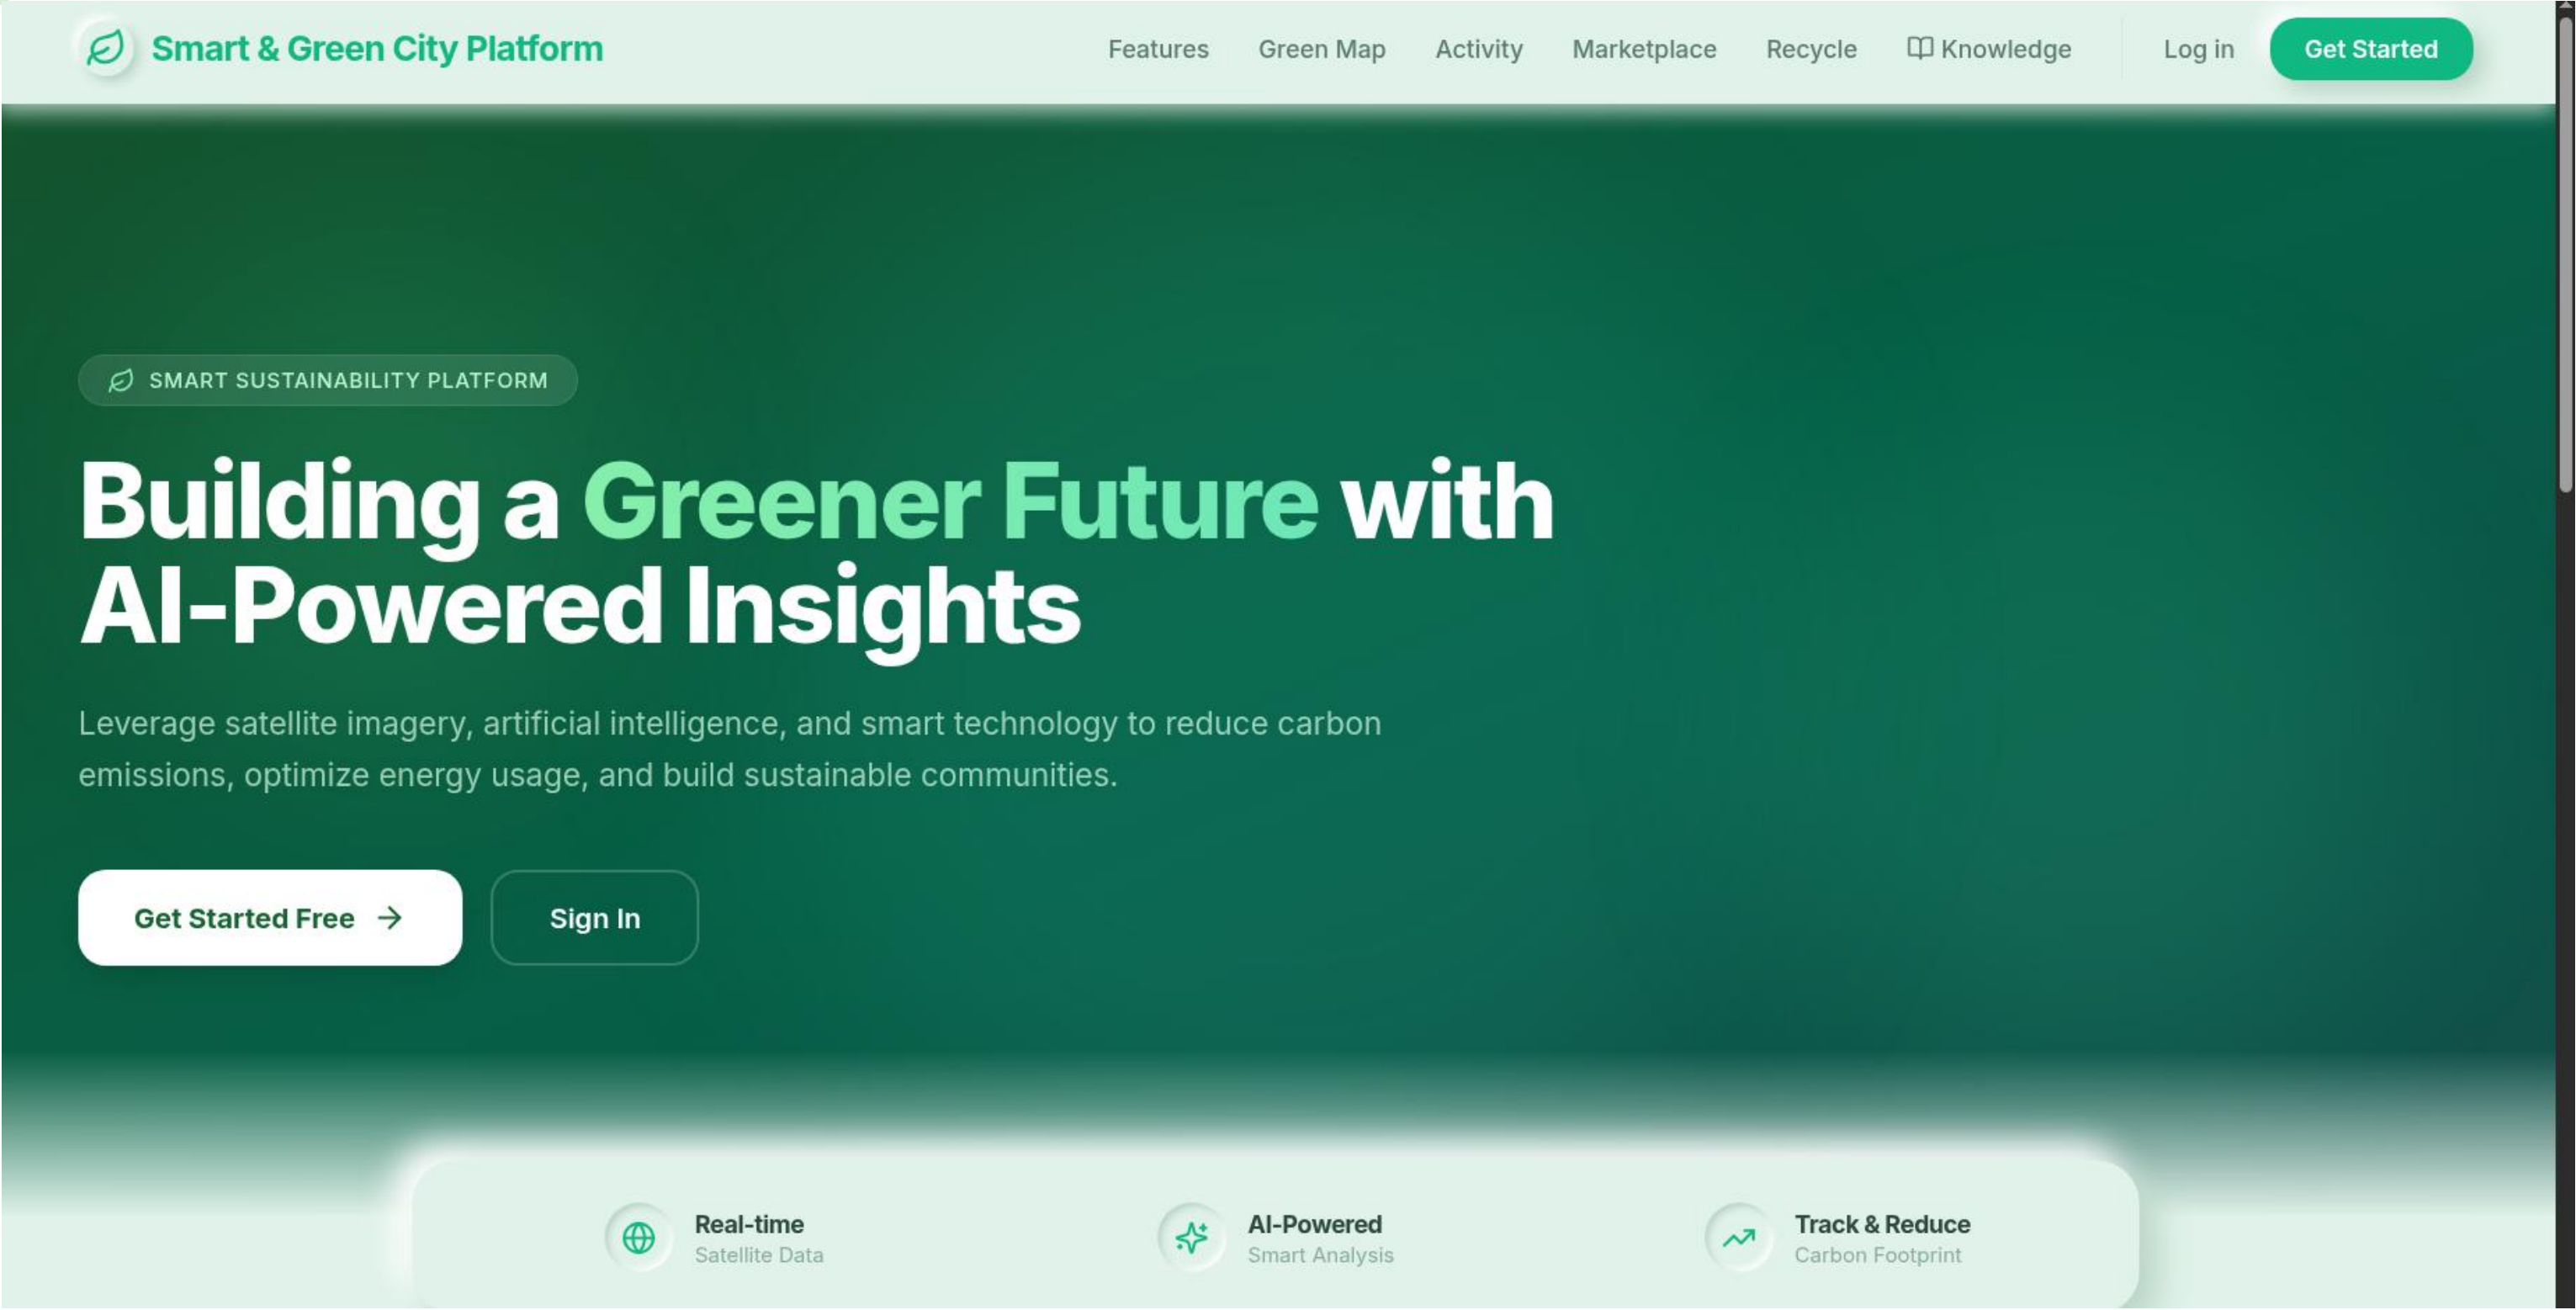

Objectives

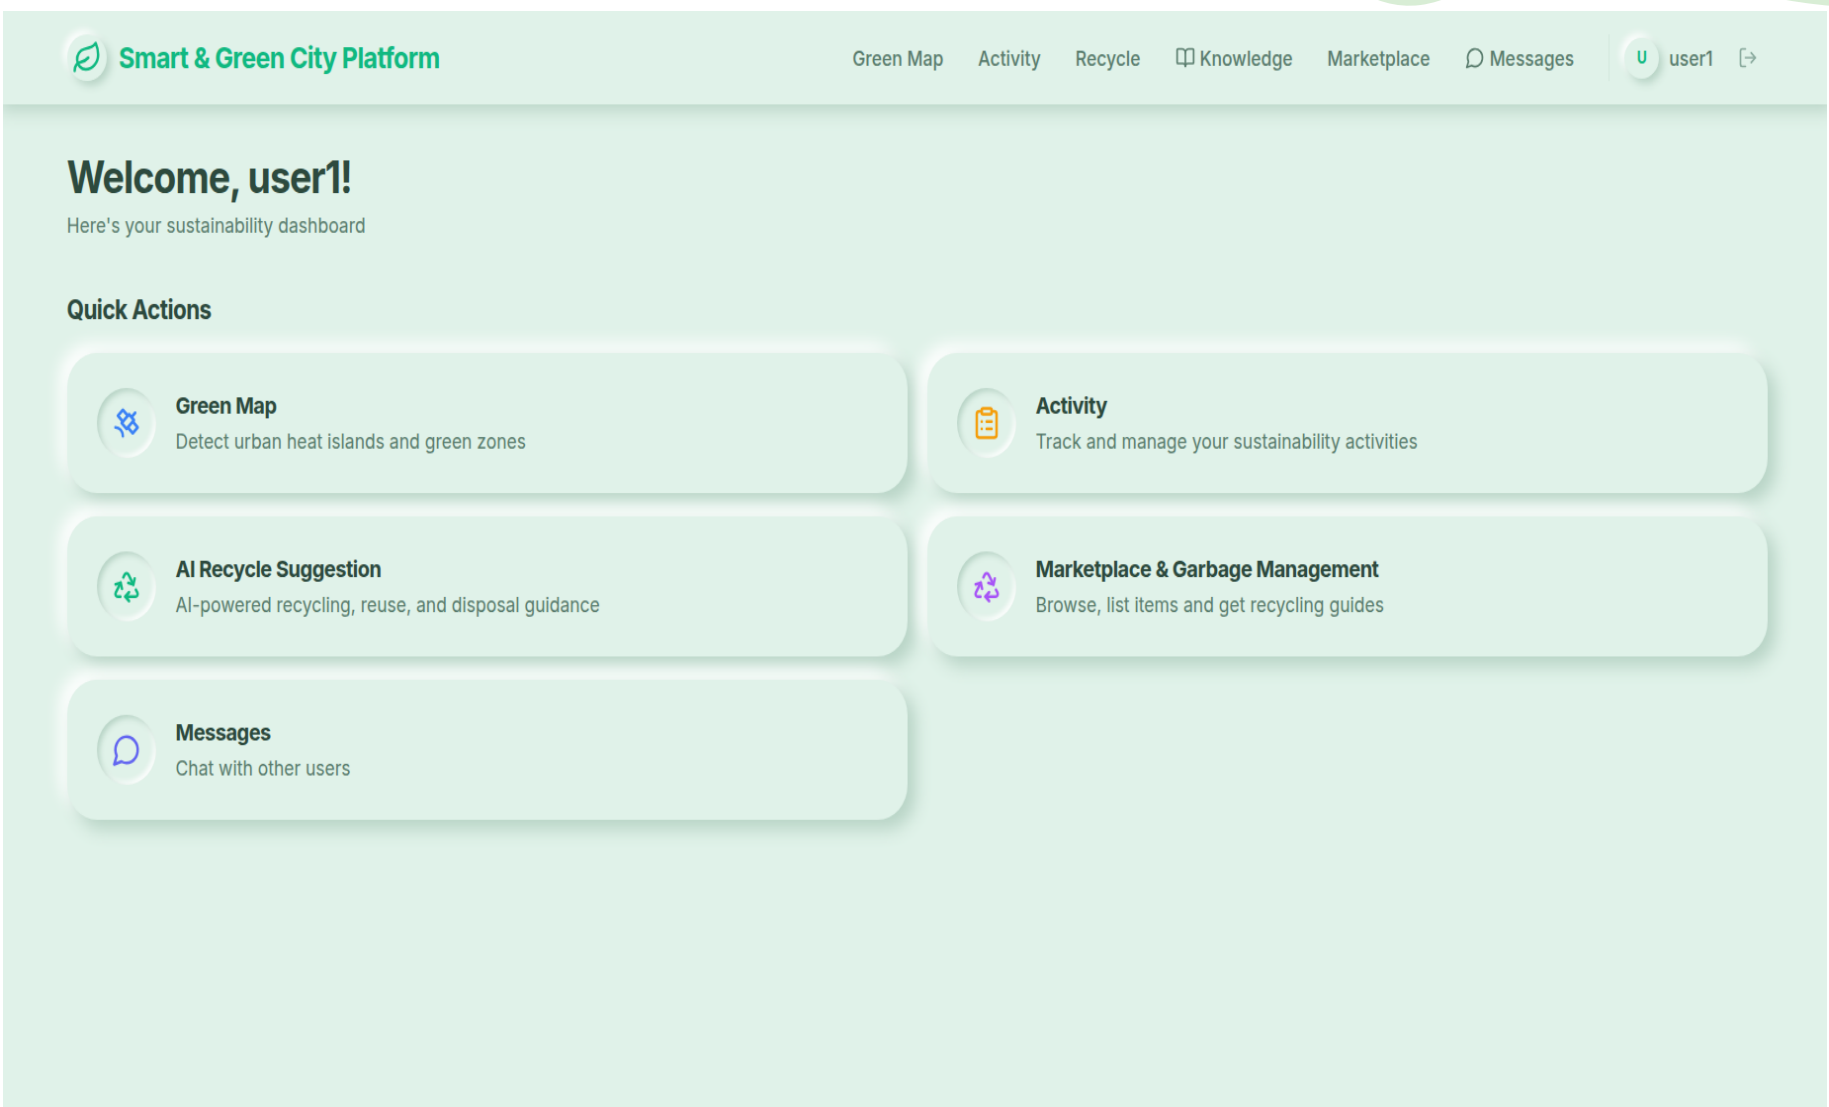

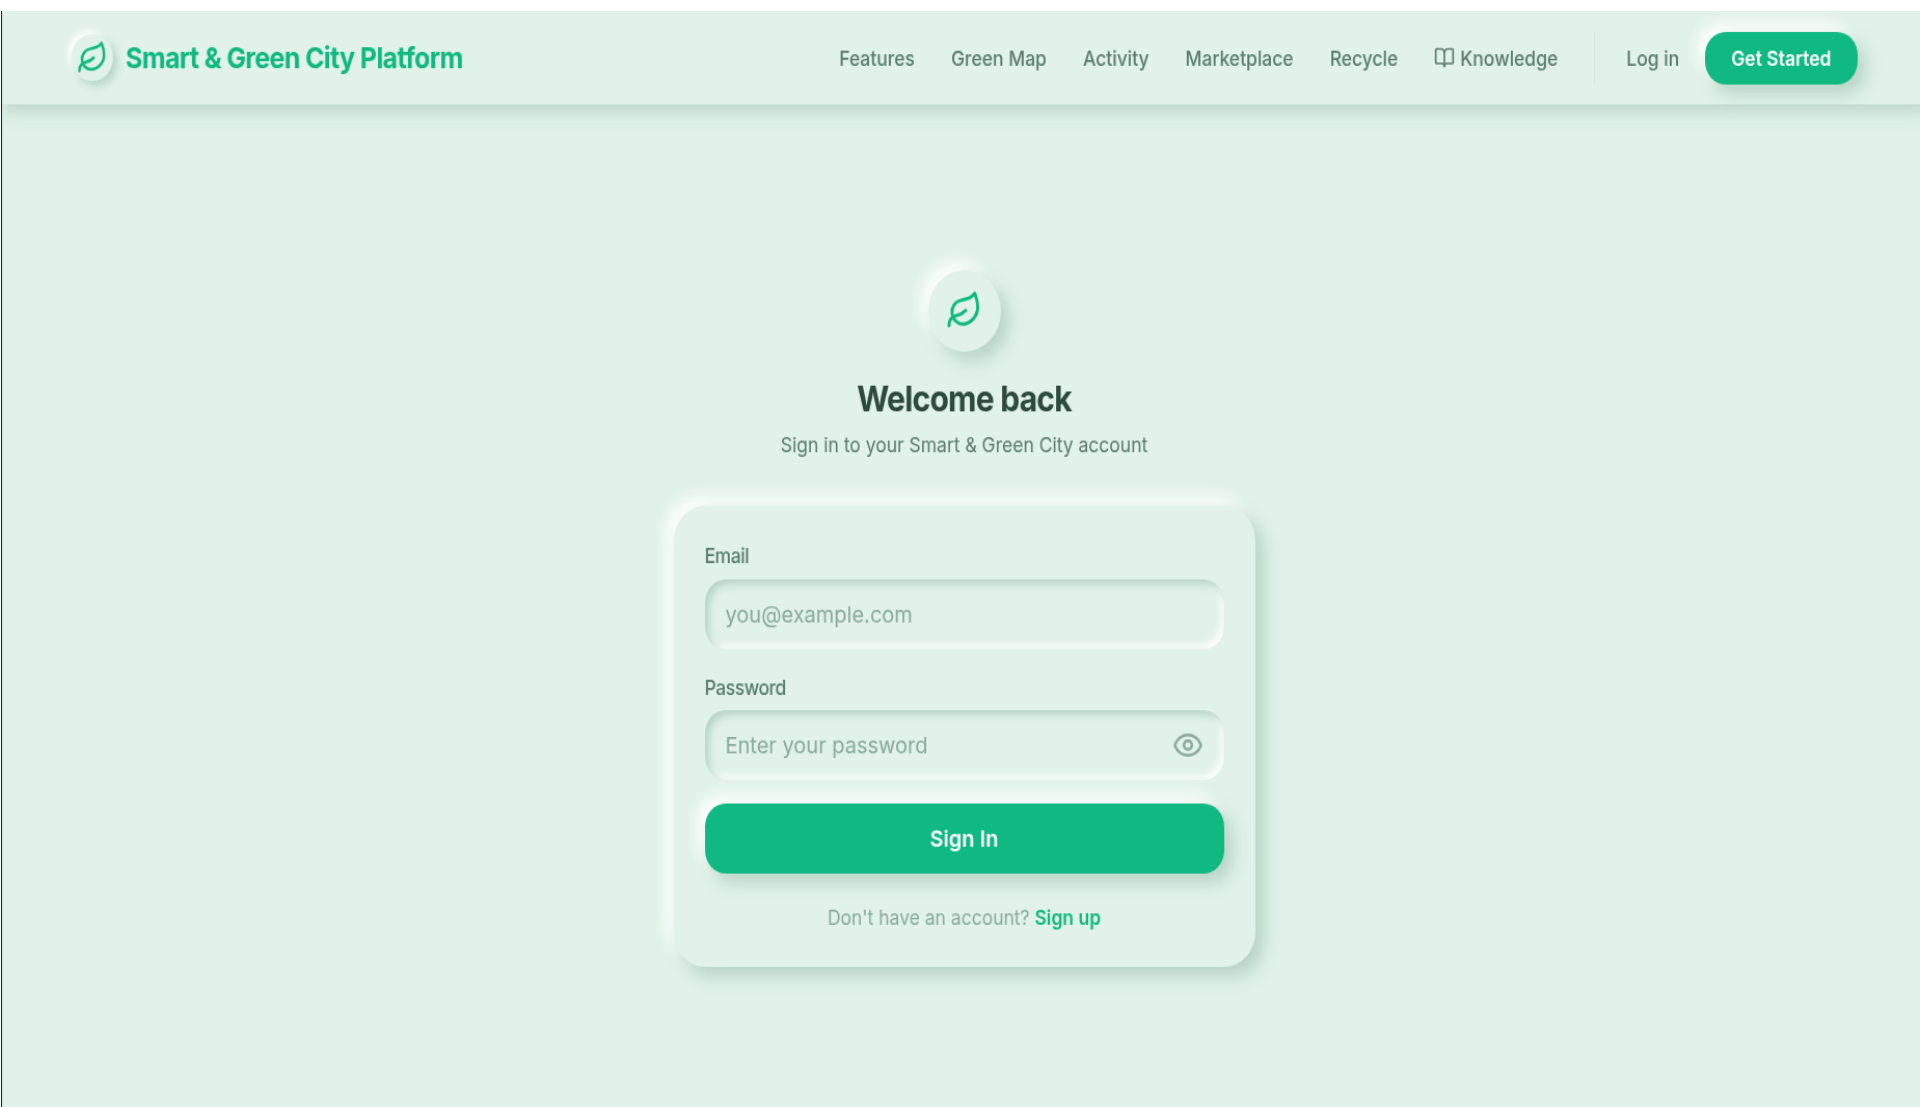

- **Reduce Waste**
Our first objective is to reduce the amount of waste by encouraging people to reuse and recycle items instead of immediately throwing them away.
- **Promote Reuse and Reselling**
We want to give unwanted items a second life by allowing users to resell or pass them on to people who need them.
- **Improve Recycling**
The system aims to encourage proper recycling by helping users identify recyclable materials and suitable recycling options.
- **Encourage Community Participation**
We want to motivate citizens to participate in green activities, challenges, and community actions.
- **Support Data-Driven Green Actions**
Environmental data can help identify areas that need more attention, allowing communities to focus their efforts where they can create a greater impact.
- **Build a Smart and Sustainable City**
Finally, we aim to combine people, community, data, and technology to create a smarter, cleaner, and more sustainable city.

Recycled Items

Advantages

- Turning Waste into Value

An item that is unwanted by one person may still be useful to another person.
Therefore, our platform helps transform:

- Waste → Resource

Instead of simply throwing items away, users can reuse, resell, or recycle them.

- Economic Benefits

Users can earn additional income by reselling unwanted items. At the same time, buyers can find useful second-hand products at more affordable prices.

- Environmental Benefits

Increasing reuse and recycling can reduce waste and help conserve natural resources.

- Community Participation

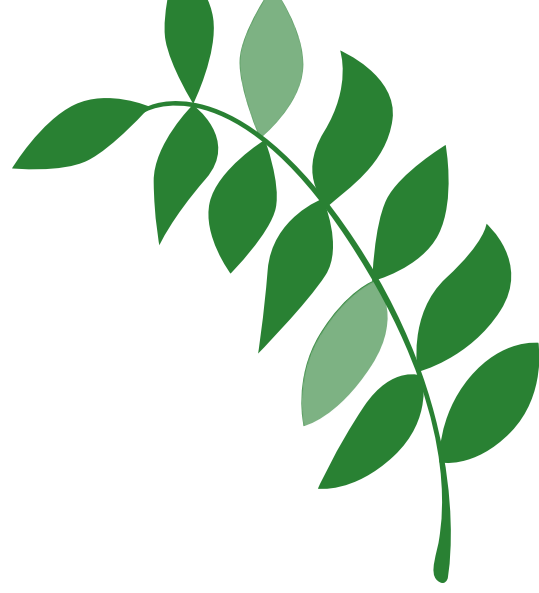

The platform encourages people to work together through green activities and community challenges. Environmental protection becomes a community effort, rather than something done by individuals alone.

- Multiple Green Solutions in One Platform

Instead of using separate platforms for reselling, recycling, and environmental activities, our system brings these functions together in one Smart & Green Platform.

Limitations

- Scan Accuracy — Item recognition may not always be 100% accurate
- Internet Dependency — Full system functionality requires an internet connection
- Location Accuracy — Map information depends on accurate location data
- User Participation — Activity success depends on community participation

Future Improvements

- Smart Recycle Scan
Photo Upload → Direct Camera Scan
- Real-Data Green Map
Integrate real-world environmental data

Conclusion

- To conclude, our project is more than just a website for selling used items or recycling waste.
- It is a platform designed to change how people think about and interact with waste
An unwanted item does not have to become waste immediately.
- It can be:
 - Reused
 - Resold
 - Recycled
- And people can take part in Green Activities through Activity.
- Our vision is to connect:
Citizen + Community + Data + Technology
to create a smarter and greener city.
- And our message is simple:
“Don’t just throw it away. Give it another way.”

THANK
YOU
